Lens

Calibration

Crystals

Test at finite distances

Crab observation

# CLAIRE : a *narrow bandpass* Laue lens

$$2d_{hkl} \sin \theta = n\lambda$$

$$E_1 = E_2 = E = 170 \text{ keV } (\infty)$$

$$r_i = f \cdot \tan [ 2 \arcsin (n\lambda/2d_i) ]$$

# CLAIRE : the lens

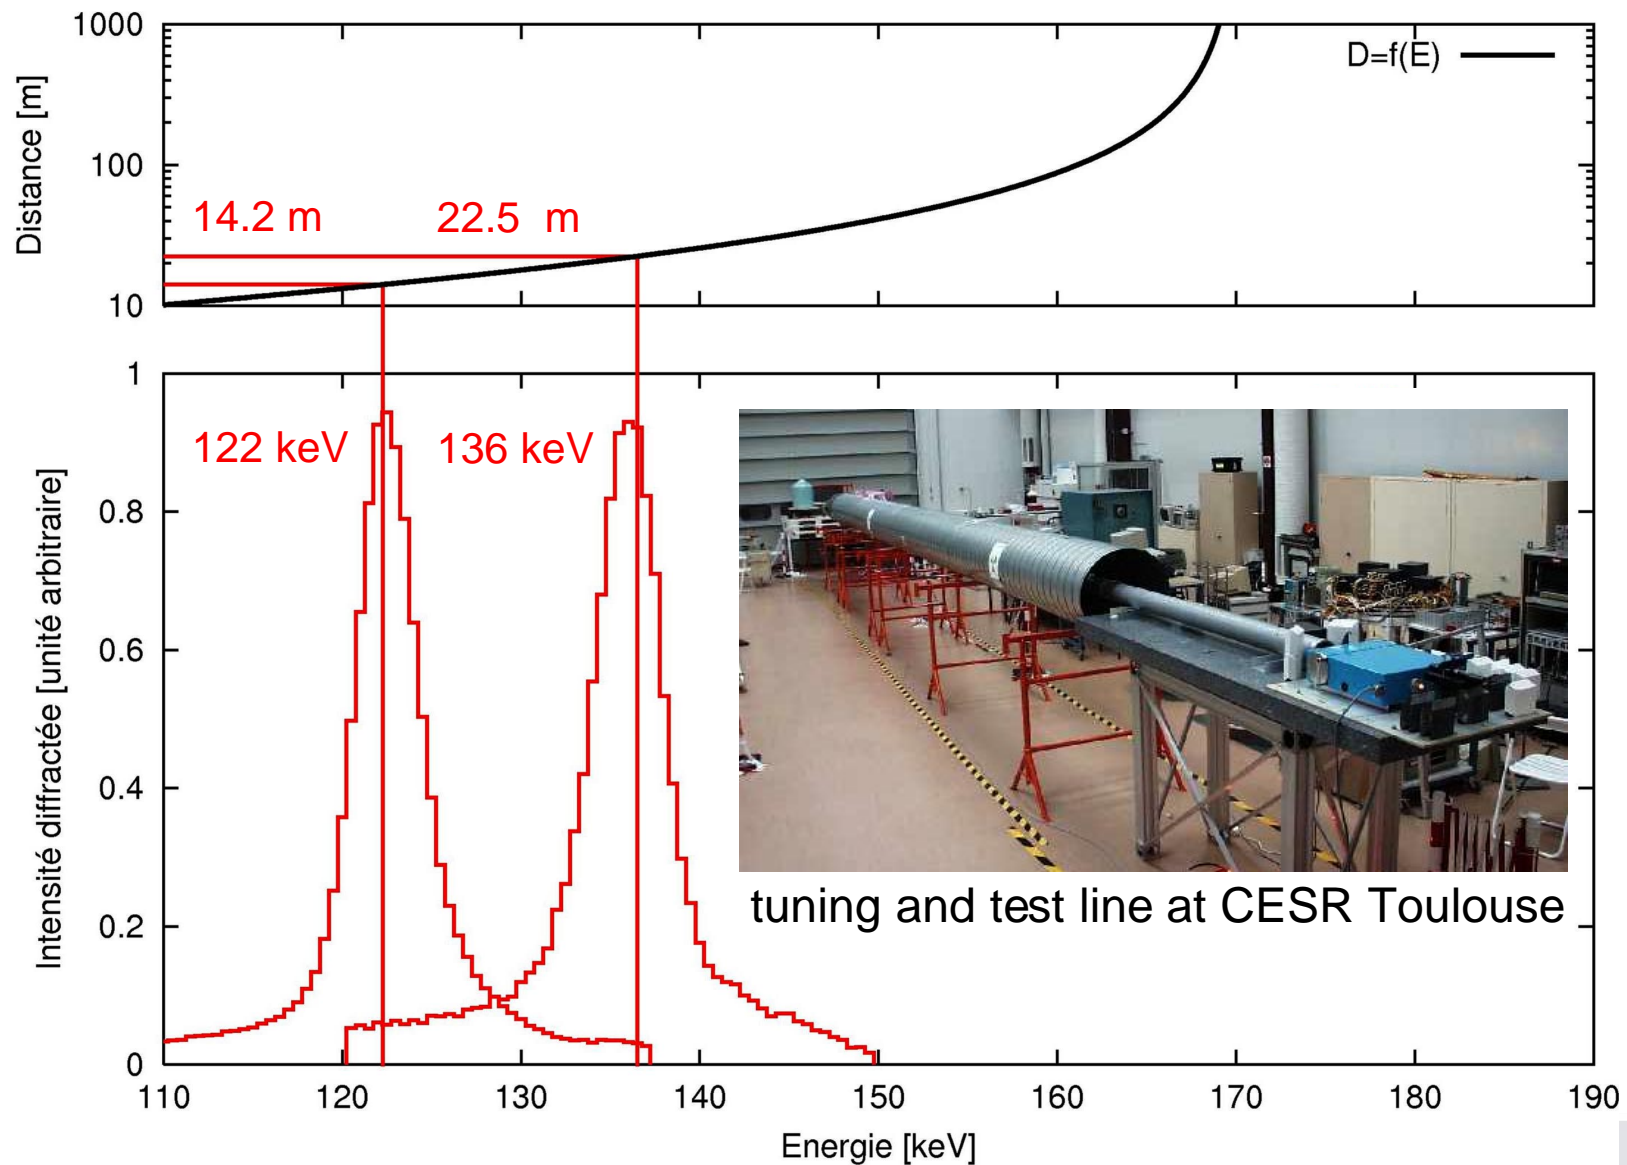

# CLAIRE : tuning of crystals

## Relation between distance and diffracted energy

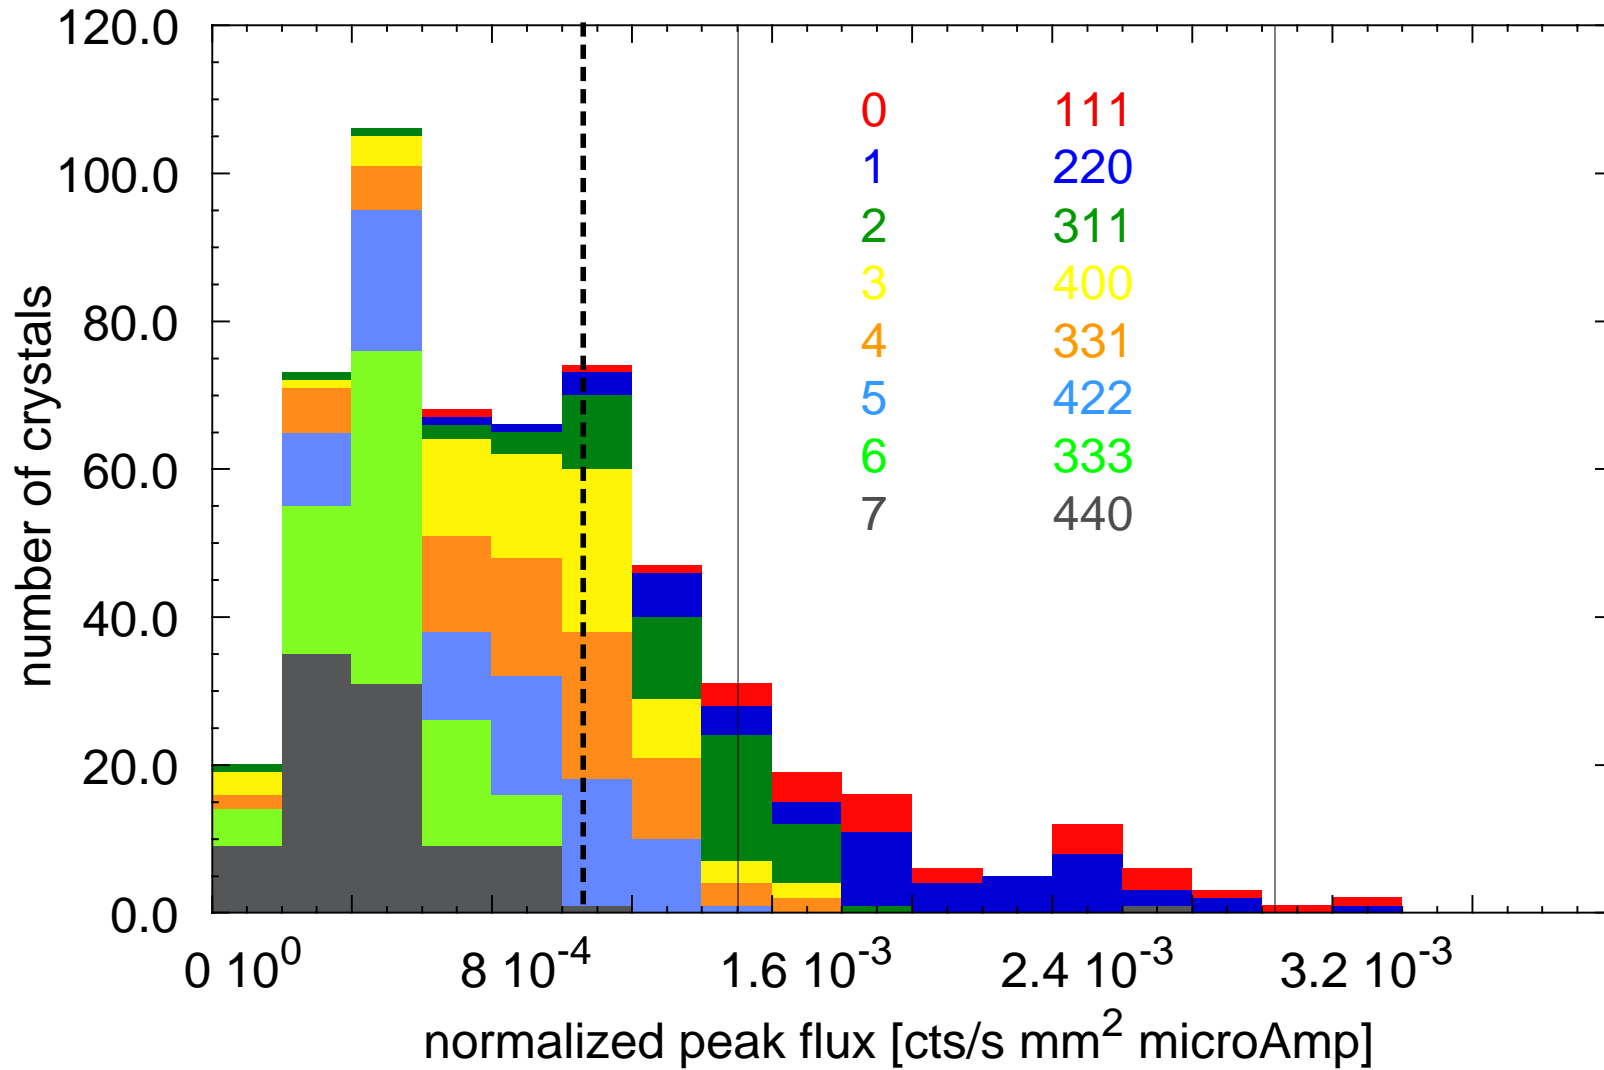

$$\frac{100 \text{ keV}}{E} = \frac{100 \text{ keV}}{E_{\infty}} + 0.3251 \left( \frac{10 \text{ m}}{D} \right) \quad \text{with } E_{\infty} = 170 \text{ keV}$$

# CLAIRE : testing the lens in the lab ... and beyond

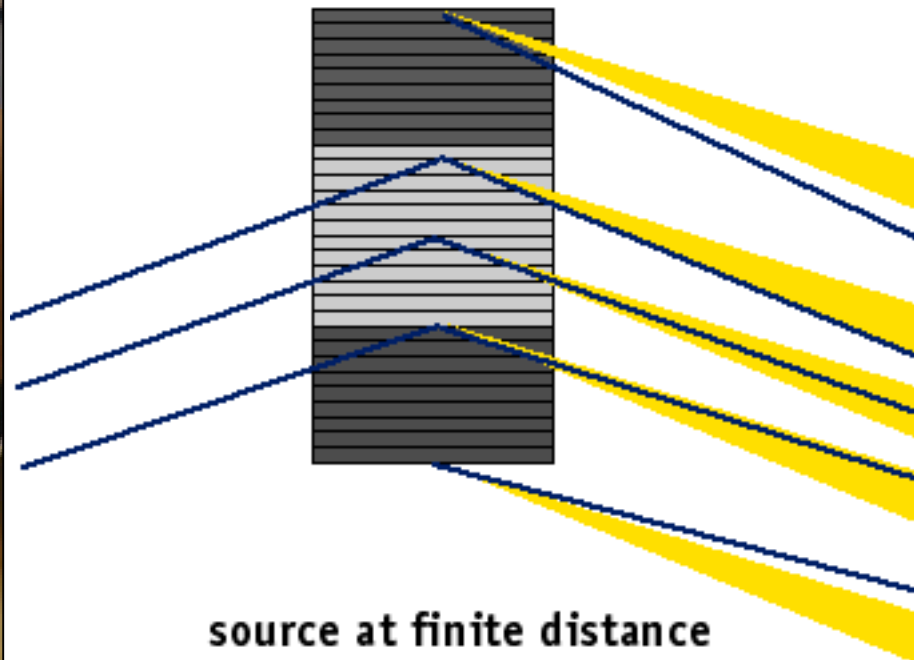

# CLAIRE : diffracted flux of 516 crystals

## CLAIRE : measuring the lens efficiency

with radioactive source ( $^{57}\text{Co}$ ) at 14 m  
measured efficiency  $\epsilon_{14\text{m}} \sim 3.2\%$

Extrapolation :  
170 keV, continuum  
 $\Rightarrow \epsilon_{\text{peak}} = 12^{\pm 1}\%$  (3 keV FWHM)

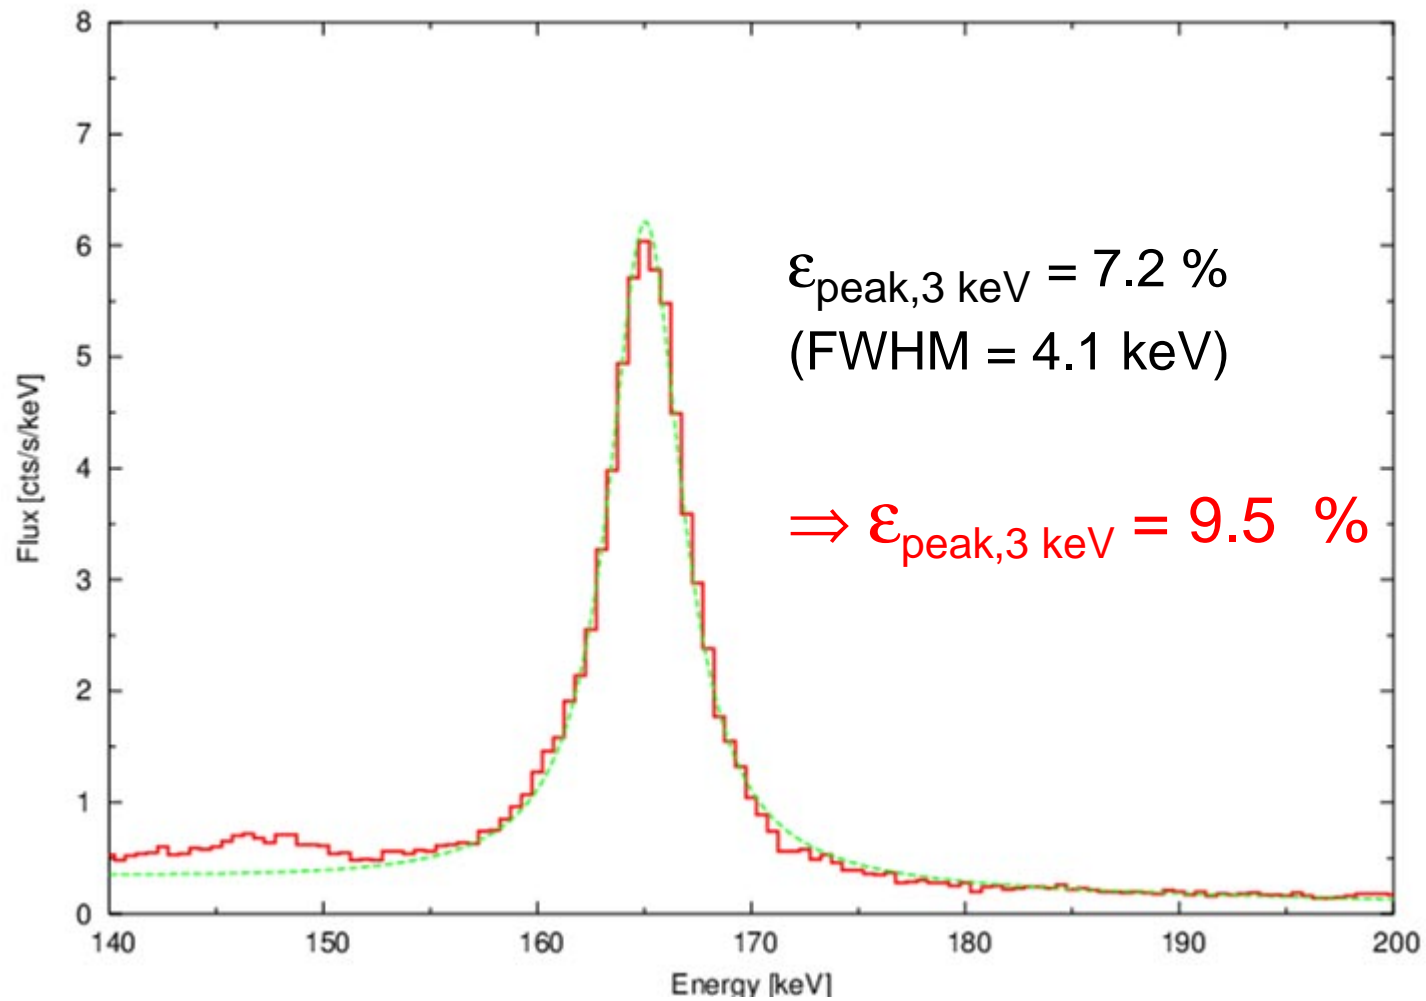

# CLAIRE TGD : a source close to "infinity" ...

# CLAIRE TGD - diffraction efficiency

# CLAIRE TGD - off axis response

**CLAIRE**

# CLAIRE : proving the the lens on an astrophysical target

but why the Crab nebula ?

- well known source ... with a continuum spectrum
- close to the "guide-star" on june 14/15 ( $\sim 1^\circ$ )

# CLAIRE 2001 : Laue lens

## lens

- 576 Ge-Si crystals
- $A_{\text{geo}} = 511 \text{ cm}^2$
- $E_{\text{diff}} = 170 \text{ keV}$ ,  $\Delta E \approx 3 \text{ keV}$
- $\text{FOV} \approx 45 \text{ arcsec}$

# CLAIRE 2001 : Laue lens, optical axis

## lens

- 576 Ge-Si crystals
- $A_{\text{geo}} = 511 \text{ cm}^2$
- $E_{\text{diff}} = 170 \text{ keV}$ ,  $\Delta E \approx 1.5 \text{ keV}$
- FOV  $\approx 45 \text{ arcsec}$

## optical axis

- inv. pixel. of rotating CCD

# CLAIRE 2001 : Laue lens, optical axis and pointing system

## lens

- 576 Ge-Si crystals
- $A_{\text{geo}} = 511 \text{ cm}^2$
- $E_{\text{diff}} = 170 \text{ keV}$ ,  $\Delta E \approx 1.5 \text{ keV}$
- FOV  $\approx 45 \text{ arcsec}$

## optical axis

- inv. pixel. of rotating CCD

## fine pointing system

- actuators **1**
  - solar sensor **2**
  - wide field CCD **3**
  - inclinometers **4**
  - gyro (Litton) **5**
- => stability  $\approx 3 \text{ arcsec}$

# CLAIRE 2001 : Ge detector array and ACS

## detector

- HPGe
- 3x3 array
- « pixel » 1.5\*1.5\*4cm

## cooling

- pressurized N dewar

## ACS

- CsI shield
- BGO collimator

# CLAIRE 2001

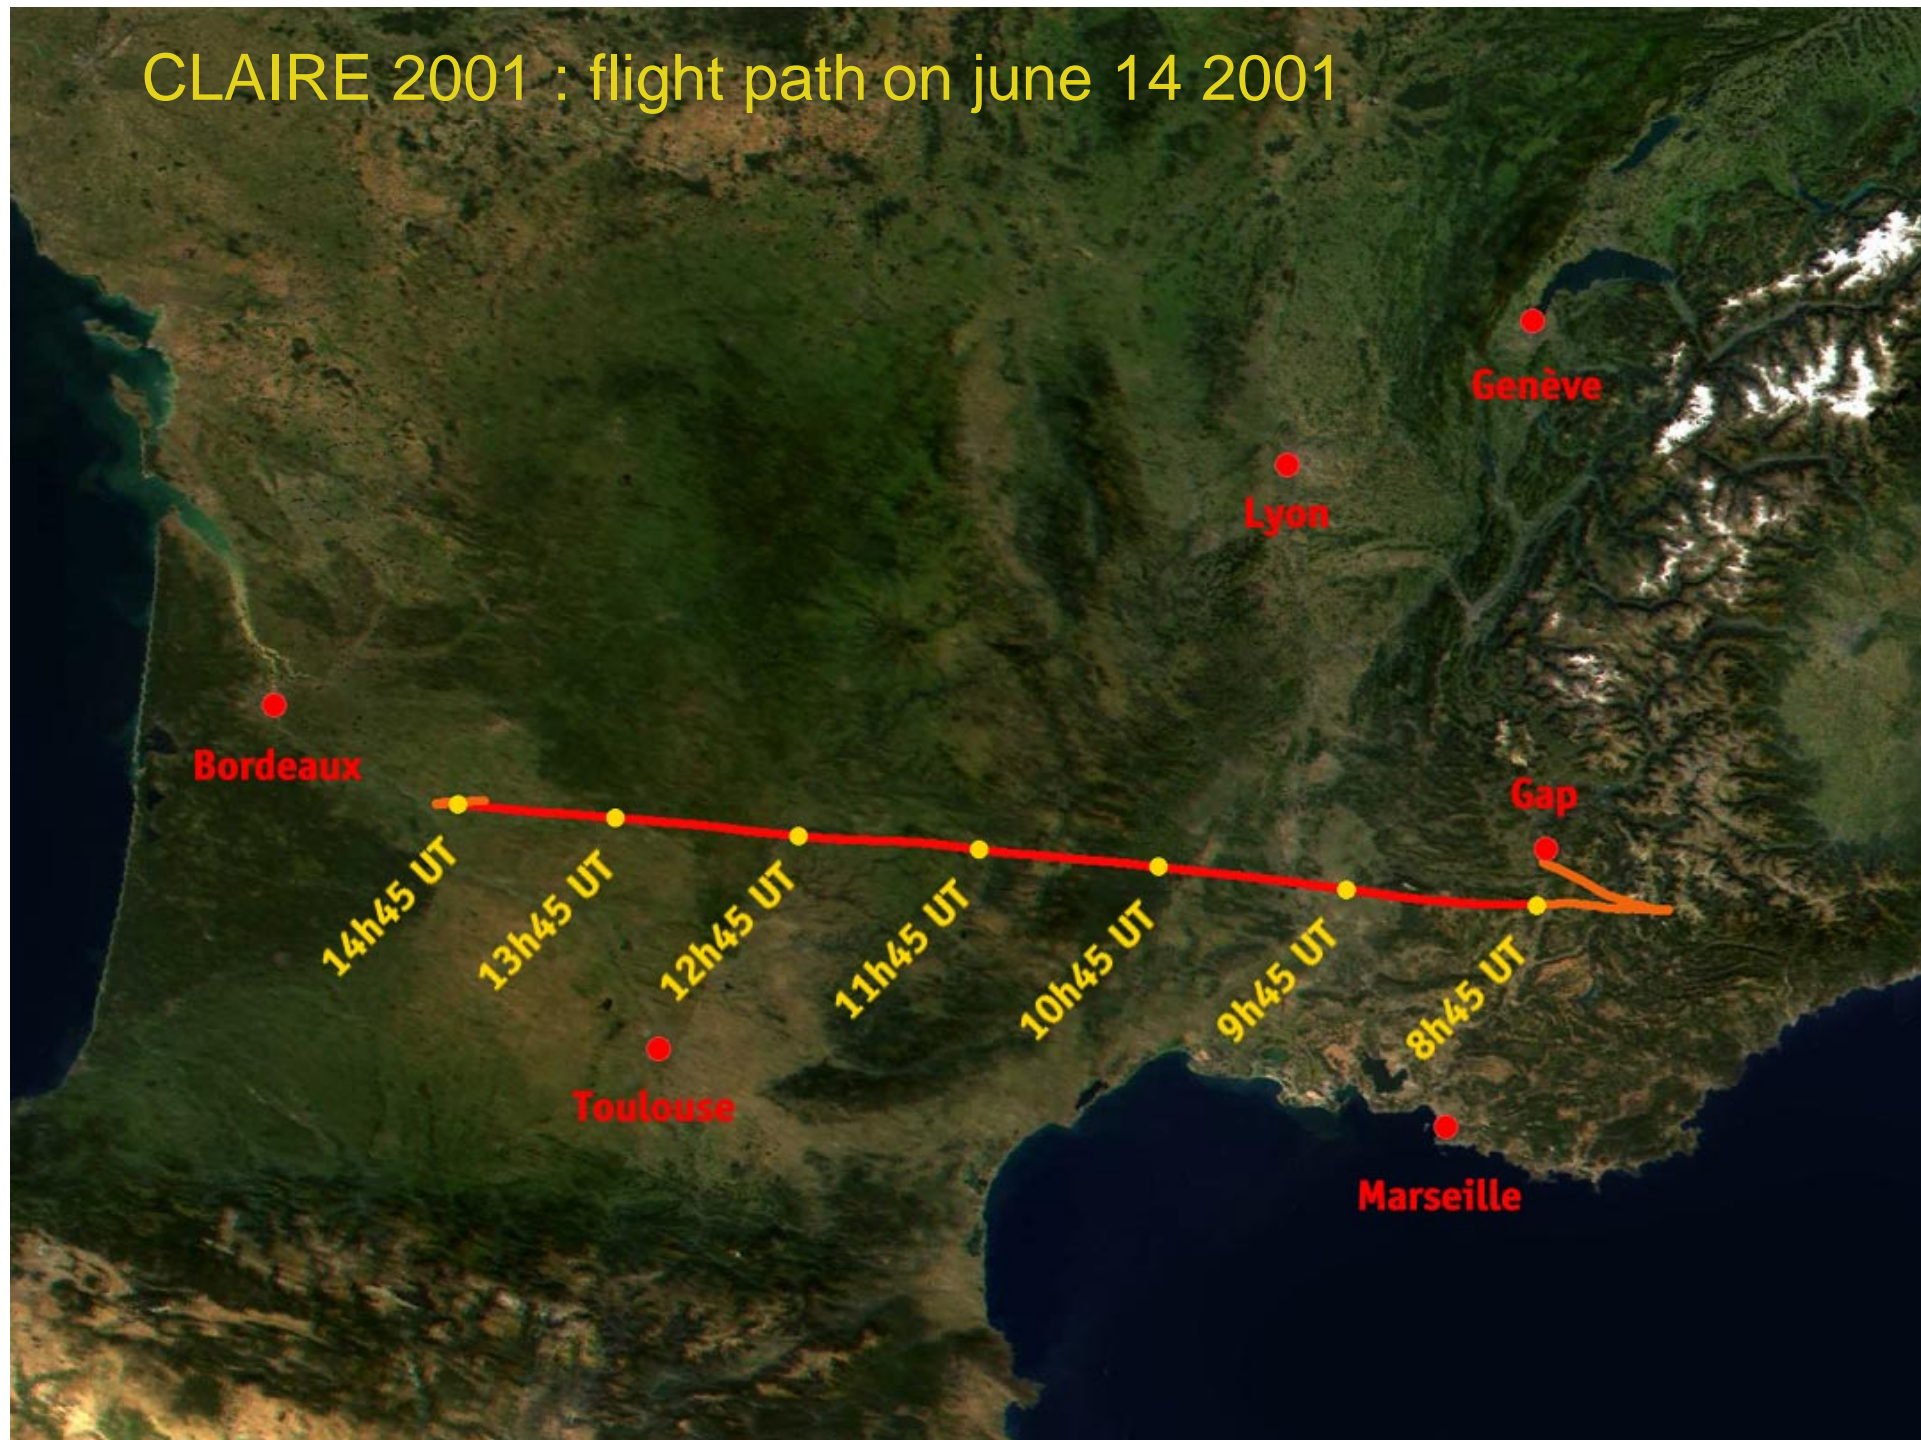

**demonstrate the principle of a  $\gamma$ -ray lens on an astrophysical target**

Launch : 14 june 2001, 8h15 UT, CNES balloon base, Gap-Tallard  
Balloon : Zodiac Z600 (600.000 m<sup>3</sup>)  
floating altitude : > 41 km (3.8 g/cm<sup>2</sup> residual atmosphère), during 5h 30'  
Landing : 14 june 2001, 17 h UT, Bergerac, Aquitaine (~Bordeaux region)

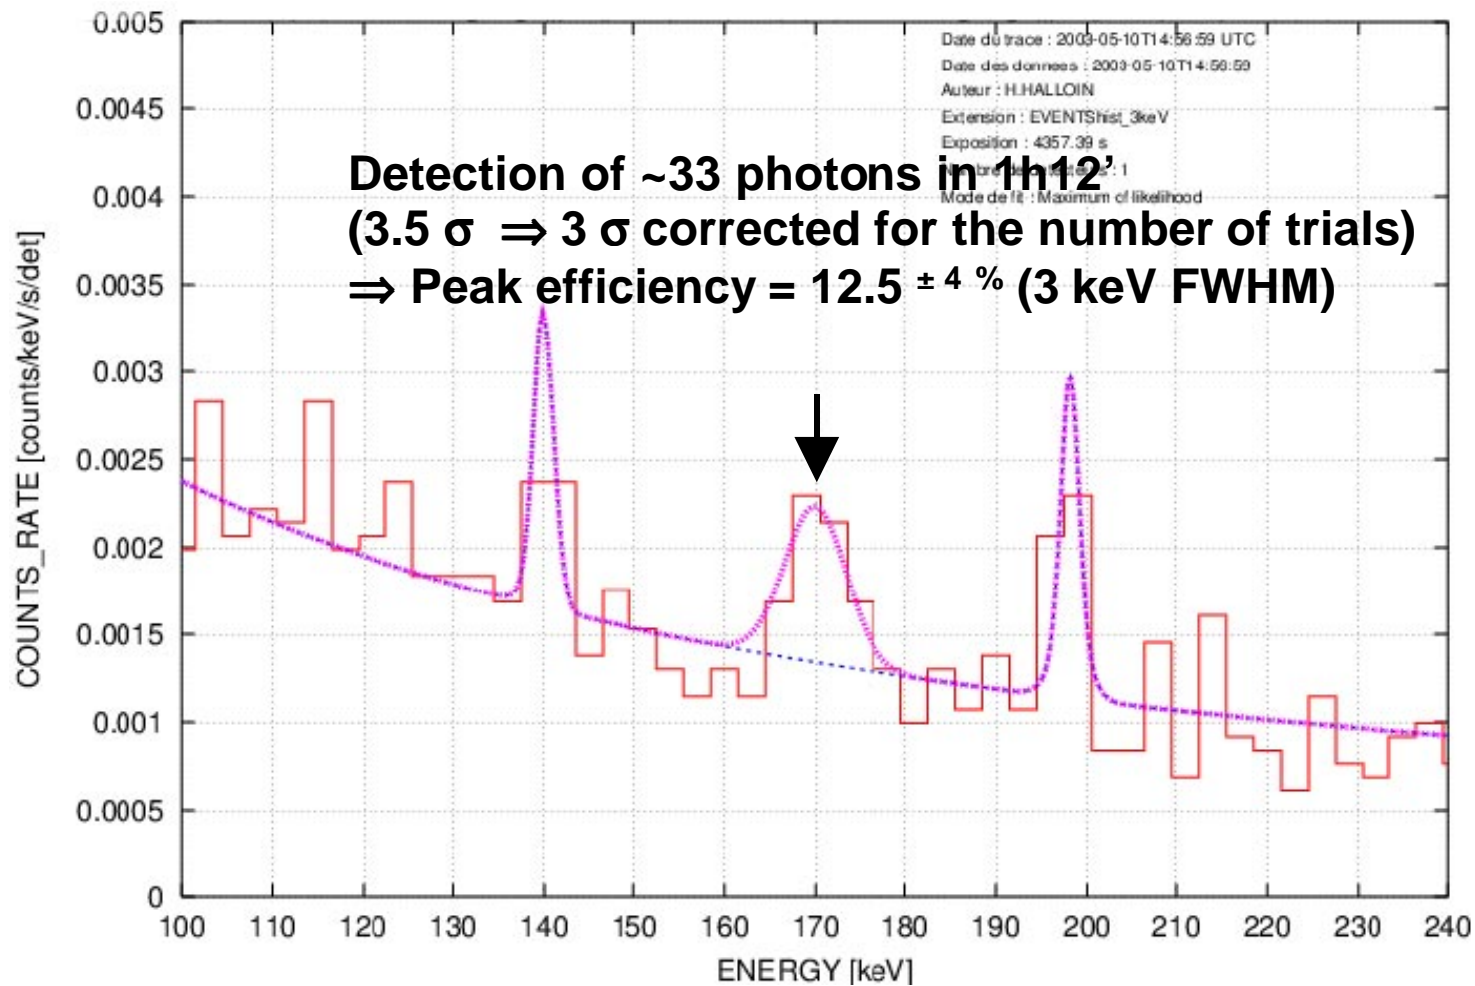

# CLAIRE 2001 : flight path on june 14 2001

# CLAIRE 2001 : pointing

# CLAIRE 2001 : first light of an astrophysical source

# CLAIRE : 14 m, 22.5 m, 205 m ... infinity !
